These models are " mixed " because they allow fixed and random effects, and they are " generalized " because they are appropriate for continuous Gaussian responses as well as binary, count, and other types of limited dependent variables.

Multilevel and Longitudinal Modeling Using Stata, Third Edition is an ideal, comprehensive introduction to generalized linear mixed models and related models for clustered and longitudinal data. Rabe-Hesketh and Skrondal explain the models and their assumptions, apply the methods to real data using Stata, and interpret the results.

This book demonstrates how to use multilevel and longitudinal modeling techniques available in the IBM SPSS mixed-effects program (MIXED). Annotated screen shots provide readers with a step-by-step understanding of each technique and navigating the program. Readers learn how to set up, run, and interpret a variety of models.

Multilevel Models for Longitudinal Data

Multilevel models for analyzing longitudinal data. Models for evaluating changes in " elevation " and " slope " over time. Using multilevel models to analyze " treatment effects " over time. The seminar will focus on the construction and interpretation of these models with the aims of appealing to users of all multilevel modeling packages (e.g., HLM, SAS PROC MIXED, MLwiN, SPSS mixed, etc).

Analyzing Longitudinal Data using Multilevel Modeling

Multilevel data structures also arise in longitudinal studies where an individual ' s responses over time are correlated with each other. Multilevel models recognise the existence of such data hierarchies by allowing for residual components at each level in the hierarchy.

Multilevel and Longitudinal Modeling Using Stata, Second Edition discusses regression modeling of clustered or hierarchical data, such as data on students nested in schools, patients in hospitals, or employees in firms. Longitudinal data are also clustered with, for instance, repeated measurements on patients or several panel waves per survey respondent.
