Cable shielding and ground loops must be disassociated. Grounding the shield at both ends attenuates the coupling to the shielded wires by approximately the ratio of load current to shield current, $S_A \approx I_{load}/I_{shield} \approx Z_T/2 \cdot Z_{load}$, where Z_T is the shield transfer impedance, l is the length, and Z_{load} is the load resistance of both loads.

The basic objectives of grounding of electrical equipment enclosures are to reduce electric shock hazards to personnel: to provide a low-impedance return path for ground fault currents to the power source so that the occurrence of fault can be sensed by the circuit protective devices and faulty circuit can be safely isolated; to minimize fire or explosion hazard by providing a ground path of adequate rating, matching the let through energy by circuit protective devices; and to provide a path ...
